

LifeView Announces Full Line of Video-Capture Multimedia Devices

LifeView has announced its full line of video-capture multimedia devices — TV Walker, FlyTV Box Pro and FlyTV Box Ultra.

The LifeView TV Walkers are USB 2.0 viewing devices that turn notebooks and PCs into powerful, portable multimedia systems, providing high-quality, real-time viewing of cable or broadcast TV and video from external sources.

The TV Walker line enables users to record and watch real-time video with MPEG-1, MPEG-2 and MPEG-4 hardware decoding. As the only USB 2.0 TV devices that are equipped with MPEG-4 hardware decoding, TV Walker products enable faster recording of highest-quality DVD-format files and make fewer demands on computers' memory and CPU resources.

The TV Walker line's unique Sili-

con Tuner supports worldwide TV systems — covering NTSC Japan/USA, PAL BG/DK/I and SECAM LL² — and can tune in up to 125 cable or broadcast channels. The Silicon Tuner reduces static and interference and, at only one-tenth the size of cam tuners, allows heat to dissipate faster. The Silicon Tuner's compact design also makes TV Walker products highly portable devices that go perfectly with a notebook computer.

Equipped with a Phillips 7135 chipset, the TV Walker line supports worldwide TV audio decoding including the NiCAM, A2 and MTS systems — not only providing users stereo TV but also allowing them access to bilingual TV in any country.

The TV Walker line's functional, user-based design and interface control functions such as TimeShift, which enables users to record any

program while watching a different one; LifeView Scheduler, which allows users to schedule recording of future programs; and Multiple Channel Preview, which provides split-screen viewing of up to 25 channels

at once. TV Walker also captures still images from video, allows users to e-mail images and enables input from external devices in either Composite Video or S-Video format. TV Walker Mini and Ultra are fully compatible with current versions of Windows.

The FlyTV Box series includes

two powerful and portable video-capture devices that allow users to transform their computer monitors into color TVs without even turning on their PCs—making the devices ideal for conserving space.

Fly TV Box Pro and Fly TV Box Ultra both come equipped with the same Silicon Tuner and Philips 7135 chipset as TV Walker products, making FlyTV products compatible with worldwide TV systems, capable of receiving up to 125 TV channels and adaptable to video frequencies in over 150 countries. Fly TV products also provide worldwide stereo and bilingual support.
