Animation Technologies Inc. Innovations Provide Mobile Computing Users with Four CardBus TV Solutions, Including Three World Firsts !

LifeView CardBus Series to cover full range of TV viewing needs and includes three World's Firsts

Taipei, Taiwan – August 9, 2004 - Animation Technologies Inc., a pioneer in video capture and TV card technologies, introduced four new products under the LifeView brand today. The CardBus Series is comprised of four different CardBus TV tuner cards designed to meet the TV entertainment needs of any laptop user. It includes the FlyTV CardBus, the FlyTV MCE CardBus, the FlyDVB-T CardBus, and the FlyDVB-T Duo.

About the FlyTV CardBus

The FlyTV CardBus is an analog TV card that supports worldwide TV and stereo sound standards. This means that users anywhere in the world can watch high resolution TV with stereo sound support. It also allows for connection of external video devices such as a VCR or camcorder for playback and video capture.

About the FlyTV MCE CardBus

The FlyTV MCE CardBus is an analog TV card that includes a hardware MPEG 1/2/4 encoder – the first to do this in a CardBus form factor. This allows users to watch, TimeShift, and record TV smoothly, even while running other programs at the same time. It also allows for lower system requirements, meaning that older laptops can still take advantage of the card's features. The FlyTV MCE CardBus is also built with a silicon tuner that gives it support for worldwide TV and stereo sound standards, and includes inputs for S-Video and composite video sources.

About the FlyDVB-T CardBus

The FlyDVB-T CardBus is the world's first digital TV CardBus card, giving notebook users a convenient way to watch and record digital TV on their notebook. Users can enjoy the increased resolution and picture quality that digital TV provides, as well as full stereo sound and EPG functionality. The FlyDVB-T CardBus is not limited to digital TV; it can also show and record video from analog devices such as VCRs and camcorders using S-Video and composite video inputs. It also takes advantage of LifeView's exclusive MST: Multiple Streaming Technology, letting users watch both digital TV and an analog source at the same time, on the same screen.

About the FlyDVB-T Duo CardBus

Last but not least, is the FlyDVB-T Duo, the world's first and only CardBus TV solution with both digital and analog TV functionality. Users can watch analog TV with support for worldwide TV and stereo sound standards, or watch crystal clear digital TV. Users can also record from external devices like a VCR or camcorder with the S-Video or composite video inputs. Furthermore, thanks to LifeView's exclusive MST technology, users can watch both digital TV and analog TV or video at the same time, on the same screen.
